Introduction to HTML and the VS Code Environment

Objective: During laboratory works 7–12, you will create a personal CV website based on the selected template. During Laboratory Work 7, you will become familiar with the Visual Studio Code environment and basic HTML tags.

Work procedure:

- Tasks must be completed in sequence. Only a fully completed task may be presented and defended to the lecturer.
- Each laboratory work (LW) is graded up to 10 points. The laboratory work consists of a mandatory task, which is worth up to 6 points when completed on time (according to the course schedule). The complementary task completed on time is worth up to 4 points.
- A mandatory task completed behind the course schedule is worth 5 points, while the complementary task is worth 2 points.
- For the assessment, you must demonstrate the completed tasks and upload them to the *GitHub* repository.

Mandatory task (6 points):

1. **Choose a CV website template:**
    a. From the three CV website templates provided in *Moodle*, choose one that you will use throughout Laboratory Works 7–12.
    b. Download the selected template and extract its contents.

2. **Create a new *GitHub* repository:**
    a. Name the repository: *[github_username].github.io*. For example, *NameSurname123.github.io*
    b. In the settings, make sure that your repository is publicly accessible.
    c. Upload all files and folders of the selected template to the repository.
    d. Check whether your CV website is available at: *https://github-username.github.io/*

3. **Prepare the *Visual Studio Code* development environment:**
    a. Install the following extensions: *Live Server* and *Prettier – Code formatter*.
    b. In *Visual Studio Code*, open the template's root folder (File → Open Folder). Familiarize yourself with the project file structure.
    c. Using *Live Server*, open the website in a browser and check whether its content is displayed correctly.

4. **Make the following content changes to the CV website**:**
    a. In the Home section of the website, replace the name, surname, and profession in the template with your own.
    b. Update the image in the Home section. Save the new image in the project image folder *assets/img*. The image must be appropriate for a CV website; for example, you may choose an illustration related to your profession.
    c. Update the HTML content of the *About* section according to the selected CV theme. Do not leave the sample text or data provided in the template.

5. **Save the changes in the *GitHub* repository.**

Complementary task (4 points):

1. **Update the website metadata in the *index.html* file:**
    a. Set the document language to English and use the <*meta*> tag to specify an appropriate character encoding.
    b. Specify the author's name and surname.
    c. Enter a short description of the website: *Name Surname CV page*.
    d. Change the page title displayed in the browser tab to: *My CV*.

2. **Update the website favicon. Choose an icon appropriate for the CV theme.**

3. **Save the changes in the *GitHub* repository.**

Assessment:

Visit your website (https://github_username.github.io) and demonstrate and explain the completed work (mandatory and/or complementary parts) during the assessment.

****NOTES:**

- A website published through *GitHub* will be publicly accessible on the internet, so do not provide sensitive personal data (phone number, email address, etc.).
- The CV may be based on your intended future profession, and the information provided may be fictional; however, it must be realistic and appropriate for a professional CV. Unrelated, random, or inappropriate content does not meet the task requirements and will not be assessed.
